TITLE: Synthesis and properties of isomeric polysiloxane rubbers B 15

SOURCE: Kauchuk i rezina, no. 12, 1964, 1-7

TOPIC TAGS: dimethylsiloxane rubber, methylpropylsiloxane rubber,
diethylsiloxane rubber, isomeric polymer, modified dimethylsiloxane

ABSTRACT: The effect of structure on the low-temperature and other properties of modified dimethylsiloxane rubber has been studied. For this purpose dimethylsiloxane (I) rubbers modified by replacing part of their dimethylsiloxane groups with methylpropylsiloxane groups were synthesized for the first time, and their properties were compared with those of rubbers I which were similarly modified with diethylsiloxane groups. The respective methylpropylsiloxane (II) and diethylsiloxane (III) rubbers were isomeric polymers which differed only in the position of the Si atom in the silicon-carbon chain. Rubbers II and III, which contained various amounts and distributions of

Cord 1/3 =

L 21142-65

ACCESSION NR: AP5001499

2

modifying groups, were synthesized: 1) from cohydrolysis products of dimethyldichlorosilane and methylpropyldichlorosilane or from diethyldichlorosilane in 1/1 molar ratio in cyclic dimethylsiloxane $[(CH_3)_2 SiO]_{3-6}$ at room temperature in the presence of H_2SO_4 ; 2) by copolymerization of cyclic dimethylsiloxanes and cyclosiloxanes isolated with aqueous alcohol from the hydrolysis products of methylpropyl or diethyldichlorosilane. The properties of rubbers II and III and of their vulcanizates and the effect of the amount (4-10 mol%) and distribution of modifying groups on these properties were studied in considerable detail. It was shown, in particular, that methylpropyl-siloxane groups lower the density and packing density of rubbers. Uniform distribution of propyl groups along the backbone of rubber II does not affect chain flexibility, but methylpropylsiloxane blocks stiffen its structure. With an increase in the modifying group content, the thermal oxidative stability of rubber III drops more sharply than that of rubber II. The low-temperature properties of vulcanizates II and III are the same. Vulcanizates III have a higher tensile strength (34-39 kg/cm²) and lower elongation (180-250%) than vulcanizates II (21-29 kg/cm² and 260-325%, respectively). Orig. art. has: 3 figures and 6 tables.

TITLE: Addition of cyclic siloxanes, containing Si-H bonds, to unsaturated compounds

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 12, 1964, 2230-2232

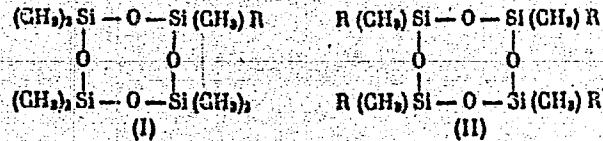

TOPIC TAGS: cyclic siloxane addition product, cyclic siloxane unsaturate adduct, synthesis

ABSTRACT: Four new addition products of Si-H bond containing cyclic siloxanes to unsaturated compounds were synthesized. The addition of heptamethylcyclotetrasiloxane (I) to α -methylstyrene, nonene-1, methylmethacrylate and allylamine, and of sym. tetramethylcyclotetrasiloxane (II) to methylmethacrylate was effected by heating the reactants in the presence of 10% chloroplatinic acid. Regardless of the nature of the unsaturated compound the cyclic structure was preserved; and IR and NMR spectral data confirmed the following structures:

TITLE: Heterocondensation synthesis of polysiloxanes containing peripheral trimethylsiloxy groups

SOURCE: Plasticheskiye massy, no. 6, 1965, 24-28

TOPIC TAGS: polysiloxane, silicon polymer, elastomer, silicon rubber

ABSTRACT: Interest in expanding the useful temperature range of polydimethylsiloxanes led to attempts to modify them by replacing the Si-methyl groups with polar, unsaturated, and bulky groups such as $-O-Si(CH_3)_3$. The preparation of silicon-containing elastomers with peripheral trialkylsiloxy groups may yield elastomers with $Si(-O-)_4$ functions in the main chain, and with improved low-temperature properties resulting from disruption of the structure regularity by mobile R_3SiO groups. The reactions of a number of suitable compounds were investigated. Two new compounds were prepared. Methyl-(trimethylsiloxy)-diethoxysilane was obtained in 65% yield from the corresponding dichloride and ethanol in the presence of pyridine.

L 53800-65

ACCESSION NR: AP5014688

Methyl-(trimethylsiloxy)-dibutoxysilane was obtained in 67% yield from the corresponding dichloride and sodium butoxide, and in 83% yield from butanol in the presence of pyridine. It was found that heterocondensation of diethyldichlorosilane and trimethylsiloxychlorosilanes with tetramethyldisiloxanediol in the presence of a HCl acceptor yields cyclic products, mainly hexamers. Higher siloxanediols yield linear products. ~~Orib art. has 1 figure and 2 tables.~~ [VS]

TITLE: A method for stabilizing siloxane rubber stocks. Class 39, No. ¹⁵⁴⁴172983

SOURCE: Byulleten' izobreteniy i tovarnyky znakov, no. 14, 1965, 76

TOPIC TAGS: synthetic rubber, siloxane

ABSTRACT: This Author's Certificate introduces a method for stabilizing siloxane rubber stocks containing highly active fillers by adding a dialkylsilyl ester of pinacol to the mixture. The period over which the technological properties of the stocks and the technical properties of the vulcanized products are maintained is increased by using 1,3,3,⁴,⁴-pentamethyl-1-ethyl-1-sila-2,5-dioxyxycyclopentane.

SOURCE: Byulleten' izobretений i tovarnykh znakov, no. 24, 1965, 20

TOPIC TAGS: siloxane, oligomer, organosilicon compound

ABSTRACT: This Author Certificate presents a preparative method for acetoxy siloxanes, based on the interaction of octamethylcyclotetrasiloxanes with acetic anhydride at high temperatures in the presence of a catalyst. To increase the yield and to obtain oligomers with 2 to 7 silicon atoms in the molecule, the reactants are mixed in the molar ratio of 1:2, and ferric chloride is used as the catalyst.

TITLE: Relationship between chemical structure and the physical constants of siloxane elastomers /Paper presented at the 20th Congress of YUPAK held in July 1965 in Moscow/ 19

SOURCE: Kauchuk i rezina, no. 7, 1966, 3-8

TOPIC TAGS: siloxane, elastomer

ABSTRACT: The relationship between the structure of modified fragments and the vitrification temperature, density, molecular volume and crystallinity of siloxane polymers was studied in detail. The substitution of some of the methyl radicals of the dimethylsiloxane group by hydrogen atoms, ethyl, propyl or butyl groups does not affect the vitrification temperature and density of the polymers very much. The introduction of vinyl groups offers a somewhat higher increase in density and vitrification temperature. Introduction of halogen atoms or nitrile groups into the side alkyl groups, substitution of the methyl radicals with phenyl radicals, or replacement of hydrogen atoms in the siloxane chain with hydrocarbon groups have a substantial effect on the parameters of the

ACC NR: AP7003499

elastomers. A linear relationship exists between the vitrification temperature and the concentration of modified groups under these conditions. The polarity of the substituents on the silicon atoms and the total mobility of the polymer chains have a definite effect on the vitrification temperature since the dimensions of the substituents play a secondary role. Ye. G. Kogana and Ye. B. Dmolkhovskoy of VNIIISK participated in the work. Also V. M. Vdovina (INNHS AN SSSR) contributed to this work. Orig. art. has: 3 figures and 2 tables. [JPRS: 38,970]
